

## Publication venues

### The “Prolific experiment” paper

Working framing:

A mixed-methods study of LLM social agents embedded in political group chat, measuring participant perceptions and independently coded conversational quality, with design implications for AI-mediated political dialogue.

### Conferences

| Conference                      | Best angle                                                                                                         | Acc %   | When    | Where    | Submit by   | Pages |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|---------|---------|----------|-------------|-------|
| <a href="#">CSCW / PACM HCI</a> | Social computing, online conversation, moderation/intervention, human-centered AI                                  | ~30%    | TBD     | TBD      | May '27     | 6-16  |
| <a href="#">ICWSM 2027</a>      | Computational social science of online political conversation; strongest if chat-log coding/statistics are central | ~20-30% | May '27 | UK       | Sep 15 '26  | 11    |
| <a href="#">FAccT 2027</a>      | Responsible AI, governance, transparency, manipulation, harms, and AI-mediated political discourse                 | ~27-33% | Jun '27 | Portugal | Oct '26     | 14    |
| <a href="#">WebSci</a>          | Web/society framing: platform-like intervention, public discourse, social media, mixed methods                     | ~27%    | May '27 | TBD      | Dec '26     | 6-10  |
| <a href="#">CUI</a>             | Conversational-agent/interface framing: multi-bot chat, user perceptions of AI participants                        | ~26-34% | Jul '27 | TBD      | Feb/Mar '27 | 12-20 |

### Journals

| Journal                                             | Best angle                                                                                                          | Acc %   | Pages | Notes                                                                                                       |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|---------|-------|-------------------------------------------------------------------------------------------------------------|
| Journal of Computer-Mediated Communication          | Best journal fit if the paper makes a strong communication-theory contribution about AI-mediated political dialogue | ~5%     | <40   | Very selective; strongest if the paper is theoretically mature, not just a system/evaluation report         |
| Social Media + Society                              | Social-media/platform implications, public discourse, moderation, political discussion                              | ~10-20% | 16    | Good fit for a polished empirical paper with broad social-media relevance                                   |
| Political Communication                             | Political communication, deliberation, misinformation correction, affective polarization, perceived legitimacy      | ~8%     | 16-20 | Best only if the theory is political communication first, HCI second                                        |
| Information, Communication & Society                | Social, cultural, and political implications of emerging communication technologies                                 | ~10%    | 16-20 | Good home for a broader "AI-mediated political discourse" argument                                          |
| Computational Communication Research                | Method-heavy communication study: coded chat logs, reliability, computational measures of dialogue quality          | 20-35%  | <18   | Good if the coding/statistical methodology becomes a centerpiece                                            |
| ACM Transactions on Social Computing                | Social-computing systems, online interaction, computational/social analysis                                         | ~20%    | —     | Natural ACM journal backup if the paper grows beyond a conference version                                   |
| ACM Transactions on Interactive Intelligent Systems | Interactive intelligent systems, conversational AI, user study, human-centered evaluation                           | ~20%    | —     | Best if the contribution is the AI interaction/system evaluation rather than political communication theory |

| Journal                                      | Best angle                                                                                              | Acc % | Pages | Notes                                                                                                         |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------|-------|-------|---------------------------------------------------------------------------------------------------------------|
| International<br>Journal of<br>Communication | Solid<br>communication-journal<br>fallback for empirical<br>work on mediated<br>political communication | ~15%  | <18   | Useful<br>non-APC<br>open-access<br>option; less<br>prestige than<br>JCMC/NMS<br>but often a<br>realistic fit |

### Suggested submission strategy

1. **First target:** CSCW, unless the chat-log coding/statistical analysis becomes much stronger than the interface/design story.
2. **Alternate first target:** ICWSM, if the paper's main contribution is computational social science of online political dialogue.
3. **Ethics/governance version:** FAccT, if the paper foregrounds transparency, manipulation, moderation, and responsible deployment of political LLM agents.
4. **Broader web/society version:** WebSci, especially if the paper is framed as a platform intervention.
5. **Journal expansion:** JCMC, Social Media + Society, or New Media & Society after the conference version, depending on how theory-heavy the final paper becomes.
